Phu Nguyen

For this lab I went through the notebook in order and ran the code myself so I could see what each part was doing. I loaded the Titanic data, then trained a Linear Regression model to predict Fare using Age and Pclass, and checked the error with mean squared error. After that I trained a Logistic Regression model to predict Survived using Age, Pclass, and Sex, and checked it with accuracy.

For the two tasks and the knowledge check questions, I got help from Claude. After that I ran the code, printed the .coef_ and looked at the numbers myself, and wrote the answers so they made sense to me.

This lab made me see the difference between regression and classification, and why each one needs a different metric. When I finished, I uploaded it to my GitHub repo and submitted it.
